

SL20-22M Wave

The SL20M WAVE or SL22M WAVE shading system is a new generation of integral blinds, designed to ensure utmost darkening efficiency, innovative design and stability over time.

Unlike traditional Venetian or roller blinds, the WAVE system uses a polyester film with wave-foil geometry, specifically designed to combine stylishness and technical functionality. The integration in 20- or 22-mm warm edge spacer bars allows perfect compatibility with the most common insulating glass panels used in the residential, commercial and public sectors.

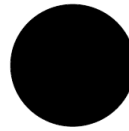

Thanks to the integrated motorisation and the Reed limit switch technology, the system offers accurate, silent and repeatable movements over time, even in conditions that are not perfectly orthogonal to the window frame. This result in a cutting-edge product, designed for those who seek maximum control of light and visual comfort, without compromising the design of the window or the integrity of the interiors.

The system is supplied already pre-assembled with the top spacer bar, with snap-on components and simplified electrical connections, designed to facilitate assembling into double glazing.

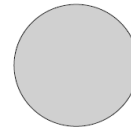

The design ensures quick and safe onsite installation, reducing assembly operations to a minimum.
